

## Silca Software Interface

Programs for generating master key systems and master keys. They export data to files in the .DAT format compatible with Silca programs. The file is then used together with Silca Software Interface (SSI) to automate key marking and cutting with Silca key-cutting machines. Manual entering of codes or marking texts is no longer necessary.

Silca has also developed a program with which to convert special formats (OEM version) to one that can be read by Silca programs. This logic can be used to interpret several types of manufacturers' original files, such as KABA and others.
